			requests and used to classify the user as someone interested in sports.”
(d) separating, by the computer system, said text item into at least one sentence;	<p>Braden 7:47-49 “each of the documents in the set is subjected to natural language processing, specifically morphological, syntactic and logical form, to produce logical forms for each sentence in that document.”</p> <p>Braden Abstract “Each such document is then subjected to natural language processing to produce a set of logical forms. Each such logical form encodes, in a word-relation-word manner, semantic relationships, particularly argument and adjunct structure, between words in a phrase.”</p> <p>Braden <i>See, e.g.</i>, 11:62-14:61.</p>	<p>Kurtzman, II 4:38-39 “Next, the individual words are passed through a stemming procedure to obtain words and word-stems (block 708).”</p> <p>Kurtzman, II, Figs. 6, 7, and 9.</p> <p>Kurtzman, II <i>See, e.g.</i>, 5:31-41.</p>	<p>See Salton 1968, p. 96 (Fig. 3-19), above.</p> <p>Salton 1968, p. 95 “The phrase finding process is completely straightforward and consists of matching the first component of a given phrase with each component of each word of a given sentence; the second phrase component is then matched, and so on.”</p> <p>Dedrick <i>See, e.g.</i>, 3:37–4:9, 5:34–6:3, 6:53–8:19, 14:65–15:10, Abstract, Figures 1–8.</p> <p>Kupiec 4:27-29 “Continuing with Example 1, suppose that the retrieved documents contain the following additional noun phrases in proximity to the noun phrase “New York City.””</p> <p>Kupiec 11:19-24 “In step 300 the input string is analyzed to determine what part of speech each word of the string is. Each word of the string is tagged to indicate whether it is a noun, verb, adjective, etc. Tagging can be accomplished, for example, by a tagger that uses a hidden Markov model. The result produced by step 300 is a tagged input string.”</p> <p>Kupiec 11:28-30 “In step 310, which comprises component steps 311 and 312, the tagged input string is analyzed to detect noun phrases. In step 315 the tagged input string is further analyzed to detect main verbs.”</p>

The '067 Patent	Braden-Harder	Kurtzman, II	Additional Prior Art References
			<p>Kupiec 13:15-21 “The match sentences are analyzed in substantially the same manner as the input string is analyzed in step 220 above. The detected phrases typically comprise noun phrases and can further comprise title phrases or other kinds of phrases. The phrases detected in the match sentences are called preliminary hypotheses.”</p> <p>Kupiec 14:45-54 “Hypotheses are verified in step 260 through lexico-syntactic analysis. Lexico-syntactic analysis comprises analysis of linguistic relations implied by lexico-syntactic patterns in the input string, constructing or generating match templates based on these relations, instantiating the templates using particular hypotheses, and then attempting to match the instantiated templates, that is, to find primary or secondary documents that contain text in which a hypothesis occurs in the context of a template.”</p> <p>Herz 13:24-27 teaches that, for the purposes of creating a profile, “one could . . . break the text into overlapping word bigrams (sequences of 2 adjacent words), or more generally, word n-grams.”</p> <p>Herz <i>See also</i> Abstract; 1:18-43; 27:47-49; 27:62-67; 4:49–8:8; 28:41–55:42; 55:44–56:14; 56:15-30; 58:57–60:9; Figures 1-16.</p>

The '067 Patent	Braden-Harder	Kurtzman, II	Additional Prior Art References
<p>(e) extracting, from each of said at least one sentence, by the computer system, at least one segment representative of a linguistic pattern of each sentence of said at least one sentence;</p>	<p>Braden 7:47-49 “each of the documents in the set is subjected to natural language processing, specifically morphological, syntactic and logical form, to produce logical forms for each sentence in that document.”</p> <p>Braden Abstract “Each such document is then subjected to natural language processing to produce a set of logical forms. Each such logical form encodes, in a word-relation-word manner, semantic relationships, particularly argument and adjunct structure, between words in a phrase.”</p> <p>Braden <i>See, e.g.</i>, 11:62-14:61.</p>	<p>Kurtzman, II 4:38-39 “Next, the individual words are passed through a stemming procedure to obtain words and word-stems (block 708).”</p> <p>Kurtzman, II 5:31-41 “Each content file in the content stream is converted into individual words. Insignificant words such as HTML formatting tags and stop words are discarded. The individual words are then passed through a stemming procedure to obtain words and word-stems. The word and word-stems are counted to determine their frequencies. These frequencies are paired with the words and word-stems to create a multidimensional vector for each content file in the content stream.”</p> <p>Kurtzman, II, Figs. 6, 7, and 9.</p>	<p>See Salton 1968 p. 96 (Fig. 3-19), above.</p> <p>Salton 1968, p. 95 “The phrase finding process is completely straightforward and consists of matching the first component of a given phrase with each component of each word of a given sentence; the second phrase component is then matched, and so on.”</p> <p>Salton 1968, p. 95 “If a particular phrase is found in a sentence, an appropriate entry is made in a chained list of concept numbers, similar in format to the list of concepts derived by the thesaurus look-up. This concept list is kept sorted by concept number, and each concept is stored together with its weight and with coded information identifying the given concept number as a phrase concept. A typical entry in the chained list is shown in Fig. 3-18.”</p> <p>Salton 1968, p. 95 “If it is also desired to use the syntactic option, those sentences containing statistical phrases are separated from the remainder of the text in order to be used later as input for the syntactic analysis programs.”</p> <p>Salton 1968, p. 158 “Automatic phrase structure recognition. A number of operating automatic recognition procedures are based on context-free phrase structure grammars [8]. This is the case notably of all so-called “syntax-directed” compiling systems used in the computer field for the recognition and translation of computer programming languages. One of the best known systems for automatic analysis of the context-free languages is the predictive analyzer [9, 10].</p>

The '067 Patent	Braden-Harder	Kurtzman, II	Additional Prior Art References
			<p>This system produces for a given sentence all possible syntactic interpretation compatible with the context-free grammar being used. . . For example, the word <i>base</i> will have a homograph assignment corresponding to <i>noun, singular</i>, one corresponding to <i>transitive verb</i>, and one corresponding to <i>adjective</i>.”</p> <p>Salton 1968, p. 166 “It appears possible, therefore, as a first step toward a more complete linguistic analysis to attempt to combine a variety of grammatically related phrase components into larger entities, termed criterion phrases or criterion trees and to assign these phrases as document identifiers in the same way other concepts extracted from the thesaurus or from the statistical phrase dictionary [20].”</p> <p>Dedrick <i>See, e.g.</i>, 3:37–4:9, 5:34–6:3, 6:53–8:19, 14:65–15:10, Abstract, Figures 1–8.</p> <p>Kupiec 4:27-29 “Continuing with Example 1, suppose that the retrieved documents contain the following additional noun phrases in proximity to the noun phrase “New York City.””</p> <p>Kupiec 11:19-24 “In step 300 the input string is analyzed to determine what part of speech each word of the string is. Each word of the string is tagged to indicate whether it is a noun, verb, adjective, etc. Tagging can be accomplished, for example, by a tagger that uses a hidden Markov model. The result produced by step 300 is a tagged input string.”</p>
